

What is Reviewable.IO?

Reviewable.IO is a web application to facilitate code reviews for GitHub projects. It is designed to improve upon GitHub's inbuilt reviewing feature to make the reviewing process clearer for everyone involved. Any steps you might have done in GitHub before can be done in Reviewable instead: comparing code changes, commenting for and back, merging and deleting or keeping merged branches. The tool is free for personal use (public and personal repositories).

Getting started

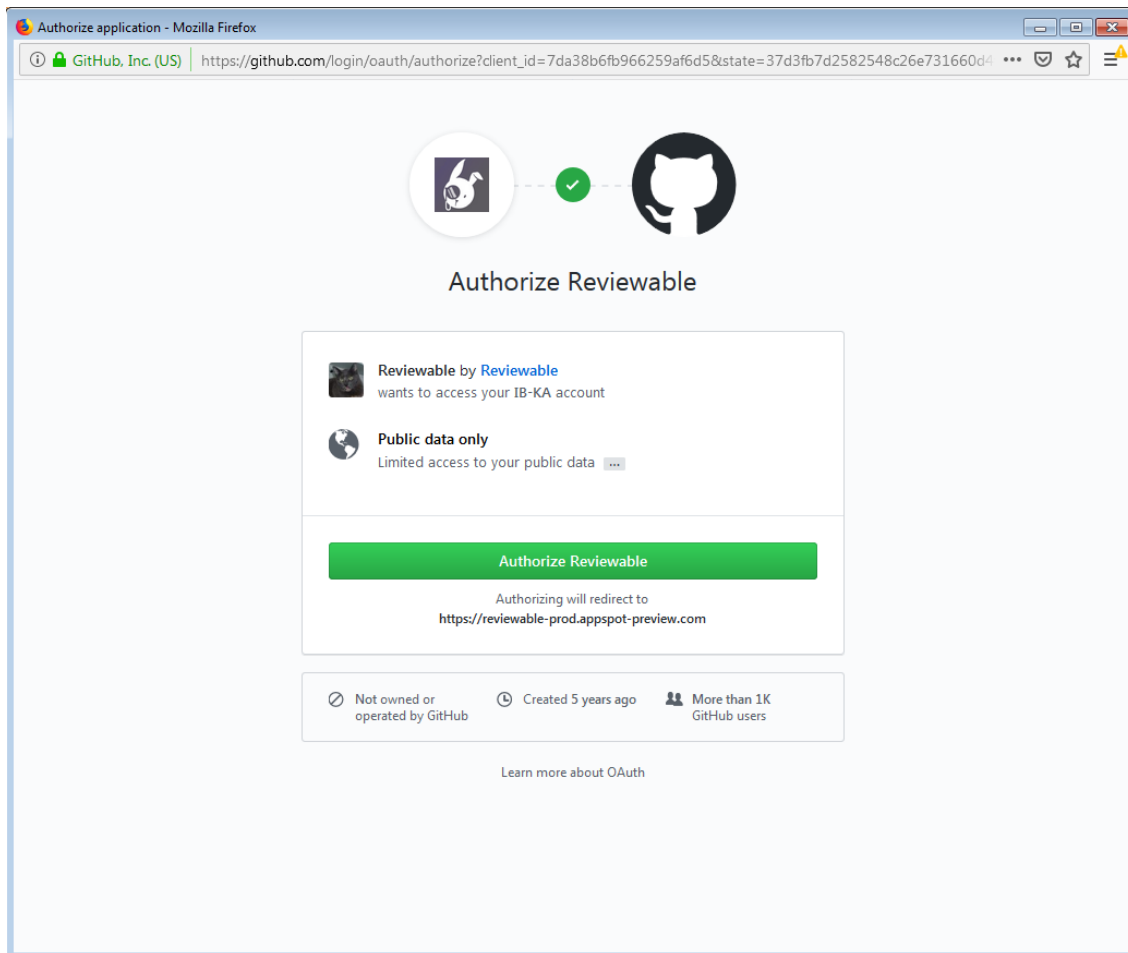

Go to your browser and open [Reviewable.IO](https://reviewable.io)

In the top right corner click "Sign in with Github"

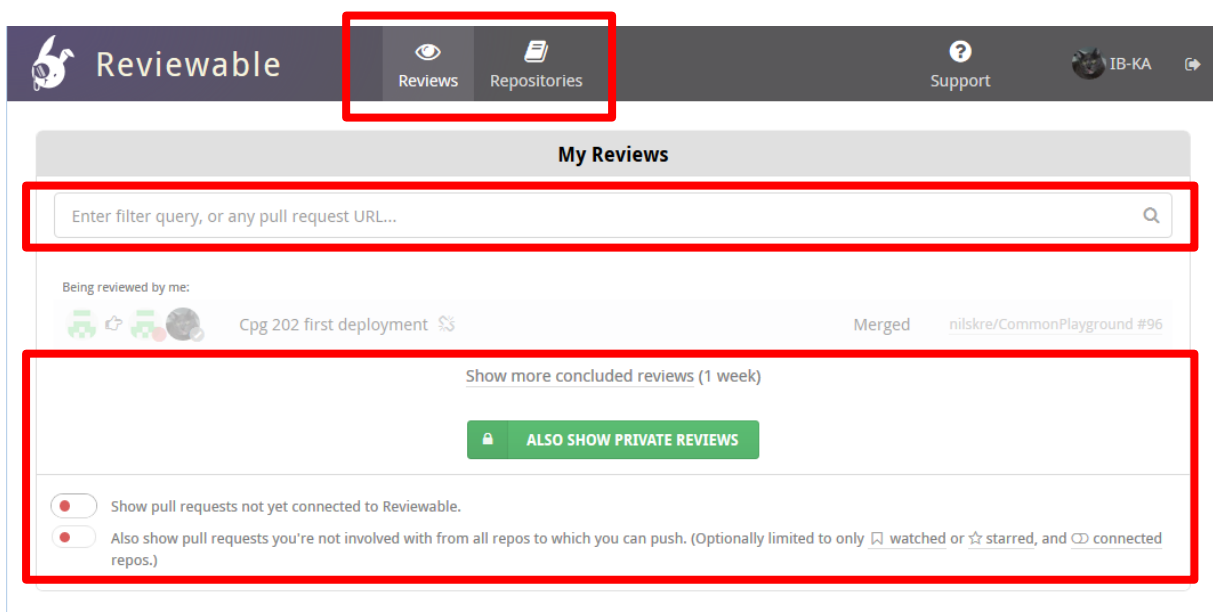

You've found the right code review tool

You will be prompted to authorize Reviewable in GitHub. That authorization can be revoked in GitHub itself under Settings – Applications – Authorized OAuth Apps

After Authorization you will be able to sign in by simply clicking the button and you will be forwarded to your personal review dashboard. You can switch between reviews and repositories and you can adjust how much you want to see.

Any pull request you have access to that is not auto-detected by Reviewable can just be added by copying the GitHub link into the search bar in the Reviews tab. You can then open the pull request and start reviewing.

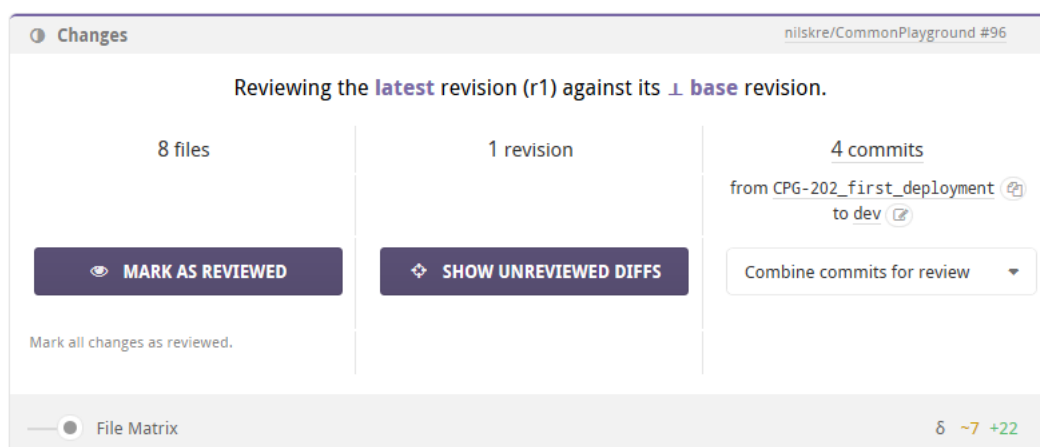

Linked repositories will also have a button re-directing you to Reviewable when you look at a pull request.

Fun with Reviews

You will see a navigation bar in the top right corner

And a summary in the center

You can review commit by commit or just get an overview over everything changed at once. You can review file changes all at once via the overview or one by one by scrolling down to the file changes or clicking on “Show unreviewed Diffs”

Below the summary you will find a file matrix showing which files are affected by the pull request and which of them already received a review and which haven't

Once a review is published the matrix will also contain information on who gave the review.

File Matrix				r1	
	.travis.yml				~2 +9
	backend/				
	Dockerfile				~1
	src/main/java/commonplayground/				
	Application.java				+5
	frontend/app/				
	build.gradle				+4
	src/main/java/com/wordpress/commonplayground/				
	view/				
	AddSessionActivity.java				~1 +1
	LoginActivity.java				~1 +1
	RegistrationActivity.java				~1 +1
	viewmodel/				
	MainActivityViewModel.java				~1 +1

NEW COMMENTS

**Cpg 202 first deployment**

first version of backend deployed to Heroku and first frontend apk

- improve Dockerfile
- adapt Server URL in the Frontend (dev for testing and prod version)
- first try to automate backend deployment (not yet tested, needs to be merged into master to test it)

**New commits in r1 (6f7c257) at 2019-04-14 17:04:17Z:**

- [d4d69e6](#): CPG-202 change start command for Backend Docker container for Heroku deployment
- [04480bc](#): CPG-202 Frontend depending on build type the App refers to localhost (debug builds) or our Heroku Docker container (release build)
- [ff19f23](#): CPG-202 Frontend Server Url uses https
- [6f7c257](#): CPG-203 add commands for deploying backend through Docker container automatically to Heroku
 - added encrypted api key for Heroku
 - add services for Heroku and Docker in Pipeline
 - Build Docker container automatically
 - tag local docker image
 - push local docker image to Heroku registry
 - release new pushed image

You can directly add comments to the corresponding code lines and submit them one by one (and annoy the person who issued the pull request) or just publish everything at the end

```
debug {
    testCoverageEnabled true
    buildConfigField "String", "TEST_TAGS", "\"${getTestTags()}\""
    buildConfigField "String", "SERVER_URL", "'http://10.0.2.2:8080/'"
}
release {
    minifyEnabled false
    proguardFiles getDefaultProguardFile('proguard-android.txt'), 'proguard-rules.pro'
    buildConfigField "String", "SERVER_URL", "'https://commonplayground.herokuapp.com/'"
    // workaround for signing. Has to be changed later:
}
```

DRAFT

Mind explaining this a bit? What are you working around and how should it be fixed later?

EXPAND

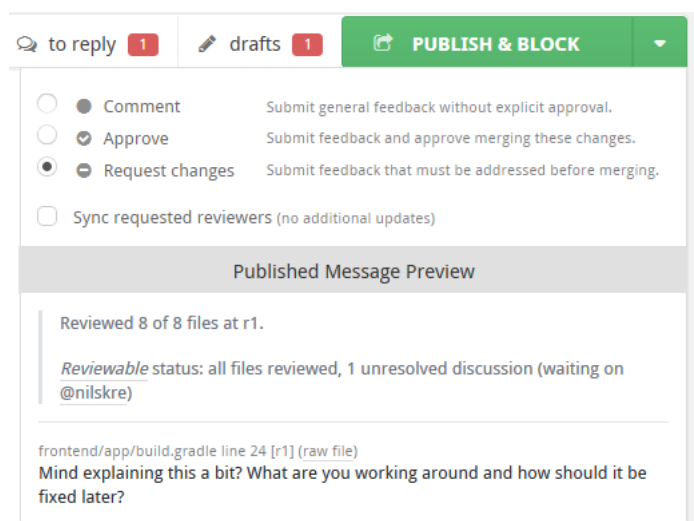

Other nice Features

If you have any deployment checks you can view them before reviewing (as you can in GitHub)

Reviewable also tells you if there are still discussion open and whether you will have a merge conflict or not

You have full control over the pull request in Reviewable as you would have in GitHub. You can add your necessary reviews here (approval) or block the PR until something is resolved. You can also call in other reviewers who you think should have a second look at this.

You can then finish the entire merging process in Reviewable. You can basically handle the entire pull request without opening GitHub once (provided your syncing already works and you don't need to copy the PR link)
